Editorial Board: V.P. Nikaylov (Resp. Ed.), Candidate of Technical Sciences, Docent; A.A. Pyshtitskiy, Professor; P.M. Vlasov, Candidate of Technical Sciences, Docent; I.J. Gocharov, Candidate of Technical Sciences, Docent; P.P. Kirovob, Candidate of Technical Sciences, Docent; S.M. Sarin, Candidate of Technical Sciences, Docent; and A.I. Kuznetsov (Resp. Secretary), Candidate of Technical Sciences, Docent; P.S. Bagatov.

PURPOSE: This book is intended for technical personnel in mechanical engineering.

CONTENTS: This collection of works deals with investigations of internal combustion engines, metal cutting, gears, resistance-type strain gauges, and wear of machine parts. No personalities are mentioned. References accompany several of the articles.

107

Kolov, I.I. Friction in the Metal-Cutting Process

The author briefly reviews some of the data available on this subject and presents the results of an investigation of the effect of cutting depth and speed, feeds, and tool angles on the cutting process. He concludes that in metal cutting the molecular interaction between cutting-tool and work surface has a great effect on the consumption of energy and tool wear.

117

Darin, I.P. [Docent, Department of the Theory of Mechanisms and Machine Parts]. Load-Carrying Capacity of Toothed Gears Made of HRC-2 "Superplastic" [Metallite-Type Material] and Working in Pairs With Steel Gears

The author presents a summary of results of a set of experimental investigations conducted on a specially built test installation in order to determine the effect of number of teeth, velocity ratio, and circumferential velocity on the performance of a pair of gears with one gear made of steel and the other of HRC-2 "superplastic." The maximum circumferential unit pressure (g/cm of the tooth width) under which no appreciable wear or failure occurred was used as a criterion in determining gear load-carrying capacity.

131

Chudakov, V.A. [Assistant Professor, Department of the Theory of Mechanisms and Machine Parts]. Performance of the Wire Grid of a Resistance-Type Strain Gauge in a Zone of High Temperatures

Effect of temperature on the resistance of a strain-gage wire is investigated. Results show that the rate of change in the resistance is a function of time and heating temperature. It decreases with time and becomes stable when held for 8 hours at 150°C.

139

Chudakov, V.A. Effect of the Shape of the Wire Grid of a Resistance-Type Strain Gauge on the Gauge Factor

Effects of grid shape, temperature, and deformation of grid wires, deformation of wires and part being tested, the number of grid loops on the gage factor are investigated. Results show that for the same grid shape the change in the number of loops between the limits of 6 and 16 has very little effect on the gage factor.

159

Korsh, M.M. [Senior Instructor, Department of the Theory of Mechanisms and Machine Parts]. Way of Improving the Resistance of Screw Mechanisms

The wear of screw mechanisms under the action of thermal stresses with square and trapezoidal screw threads is investigated. Results show that the use of a modified cast iron bearing in place of bronze and the replacement of square threads by trapezoidal will increase the wear resistance.

171

Durak, A.A. [Assistant Professor, Department of Metal Technology and the Science of Metals]. A Method of Designing Hypoid Gears With Circular Tooth Form

The method described reduces design calculations and may be used in the design of hypoid gears with a spiral angle equal to zero.

191

Kondashov, I.G. [Assistant Professor, Department of the Theory of Mechanisms and Machine Parts]. On the Problem of Stability in the Tightening of Bolted Joints Under Random Loading

The author presents the results of a theoretical investigation of the process of loosening of bolted joints subjected to vibratory loads.

"Morphology of the Mink's Blood."

Warsaw-Lublin, Medycyna Weterynaryjna, Vol 19, No 3, Mar 63, pp 165-168.

Abstract: [Authors' English summary modified] Investigation of white and red cell counts, reticulocyte count, hematocrit index, hemoglobin in 100 ml of blood, and leukogram revealed differences in the blood of minks subjected to nervous stimulation and those subjected to ether anaesthesia. The nervously excited animals exhibited a higher erythrocyte count, higher hematocrit index, and higher Hb content than the anesthetized animals. These differences are most likely caused by reflex changes in the distribution of the blood contents. It was found that there are also differences in the number of reticulocytes and in the leukogram. Of the seven references, six are Polish and one German.

Warsaw-Lublin, Medycyna Weterynaryjna, Vol 19, No 5, May '63, pp 250-254.

Abstract: [Authors' English summary] Investigations revealed that the subcutaneous fat tissue of the minks varies in composition from its fat around the kidneys and mesentery. It is considerably richer in palmitic and linoleic acids, poorer in stearic, and contains about the same percentage of myristinic acid (7 percent). The composition and easier accessibility of the subcutaneous fat offers a possibility of its utilization, primarily in the cosmetic and pharmaceutical industries. There are nine (9) references, of which 6 are Polish, 2 German, and one is English.

TITLE: Stability Loss Due to Deformation of Cross-Section

PERIODICAL: Rozprawy Inżynierskie, 1960, Vol 8, No 1, pp 45 - 61

TEXT: The stability loss caused in a thin-walled hollow bar with closed square cross-section by deformation of the walls in their planes with the beam axis remaining rectilinear, is analyzed by dealing with one wall subjected to a force and two reactions from the adjacent force, obtained from a transcendental equation. This is given in terms of the critical force of Eulerian buckling, using a coefficient derived from a transcendental equation. Dimensions of the bar are given for two different values of the coefficient derived. The analysis is then taken up using the energy method of Timoshenko (Ref. 1), and values are computed for the dimensions and the coefficient derived above. The errors do not exceed 1%. Next, the above considerations are extended to deformations in the plastic range using the theory of shear modulus of Engesser, which is justified by Karman's, Shanley's and Bleich's work in this field (Ref. 2). It is concluded that the critical load may be lower than the Eulerian force, but

Card 1/2

Stability Loss Due to Deformation of Cross-Section

this is most unlikely to occur in the plastic or elastic range for bars of practical dimensions; however, bars having a low modulus of elasticity and a high elastic limit may be amenable to practical considerations using this method of attack. There are 5 diagrams, 3 tables and 3 references: 2 English and 1 Polish.

TITLE:

The Influence of Deformability of the Cross-Section on the Eulerian Critical Force of a Thin-Walled Beam *10*

PERIODICAL: Rozprawy Inżynierskie, 1960, Vol 8, No 1, pp 101 - 119

TEXT: A double-T bar is subjected to compression and the influence of the resulting deformation of the cross-section on the Eulerian critical force, within the elastic range, is considered under the following conditions: the end supports are hinged and non-deformable, the critical stress of local buckling and the horizontal elements are not deformed in the plane of the entire cross-section. The buckling conditions are given by a transcendental equation derived under separate consideration of the vertical and the horizontal elements; the former being subjected to bending and compression, the latter being subjected to bending, compression and torsion. An iteration method is then developed to calculate the critical force, and the load on the horizontal elements is calculated by assuming the Eulerian stress as the first approximation. Quadratic equations are used to calculate successive approximations, and even though the iteration does not prove

The Influence of Deformability of the Cross-Section on the Eulerian Critical Force of a Thin-Walled Beam

to converge rapidly, good results are obtained by interpolation. Finally, tables giving the values of various parameters of the dimensions and values of the Eulerian forces are related. These relations are discussed with regard to rolled and welded girders and a table giving results of the discussion, as applied to rolled girders is presented. There are 5 diagrams, 3 tables and 12 references: 4 English, 4 Polish, 2 German, 1 Danish and 1 Soviet.

Chudziński R. The Mechanization of Shell Moulding.  
„Mechanizacja formowania skorupowego” Przegląd Odlewnictwa.  
No. 2, 1957, pp. 33—39, 7 figs. 18 3

In mechanization of shell moulding, four principal methods of producing shell moulds have been developed 1) covering the pattern plate with mixture by means of a rotary container, 2) the usual spreading of the mixture on the rotary pattern plate, 3) distributing the mixture on the pattern plate by means of an air conveyor, 4) blowing the mixture through a perforated plate having a shape strictly corresponding to that of the pattern plate. The third method permits the use of two-layer shells which in turn make possible a great economy of deficit resins. In the last method, the thickness of the shell is determined by the distance between the perforated plate and the pattern plate. For blowing shell moulds, a new kind of moulding sand is used, called „pre-coated” sand. The first shell moulding machine produced in this country is, according to the classification made by F. Galy, of the class with one stable oven and with the shifting of pattern plates in a straight line. A description is given of the principle of operating Suttler S.P. 1100 moulding machine and the F 50/65 moulding machine for two-layer shells. The Polygram firm has, for gluing the shells, recently introduced a press which has two elastic diaphragms and takes the advantage of atmospheric pressure. JMA BB

*zikiewicz T. I. Klin. Chor. Wewn. A. M., Kraków - POL. TYG. LEK.*

1957, 12/24 (901-904) Graphs 1 Tables 3

212 patients were examined, 180 men (84.9%) and 32 women (15.1%), including 136 intellectual workers (64.1%), 49 qualified workers and artisans (23.1%) and 27 manual workers (12.8%). The greatest incidence of myocardial infarction was found in men between 50 and 55 yr. ; in women between 55 and 60 yr. The average age of men suffering from myocardial infarction amounted to 54 yr., in women to 57 yr. Physicians fall victims to myocardial infarction in the youngest age group. The oldest group of patients consisted of officials and of manual workers. The season of the year - besides summer, when the incidence is the lowest - has no influence on the incidence of myocardial infarction. The actual meteorological-climatic conditions are important. Among women the incidence of myocardial infarction is most frequent among housewives.

Chudzinski J. Glass as a Substitute for Steel in Gauges.

"Szkło jako materiał zastępczy do wyrobu sprawdzianów statycznych".  
Przegląd Mechaniczny. No. 6. 1953, pp. 317-321, 17 figs., 7 tabs.

The author deals with the prospects and applicability of technical glass in the manufacture of non-adjustable gauges. He demonstrates the greater economy in use, and stresses the fact that glass gauges

cost 60 per cent less to make than do steel gauges. Moreover, the introduction of glass gauges results in an appreciable saving in steel used in such gauges and of tool steel used in machining them. The article contains, together with suggestions, details as to the chemical composition of glass used in gauge manufacture, physical and chemical properties of such glass, glass gauge types, design, manufacturing methods and processing and test results.

PERIODICAL: Szkło i Ceramika, no. 12, 1962, 357-374

TEXT: A summary of one of the 6 lectures given at a seminar held under the auspices of Instytut Elektrotechniki (Institute of Electrical Technology) at Warszawa-Międzylesie in June 1962. The seminar was attended by representatives of Akademia Górniczo-Hutnicza (Academy of Mining and Metallurgy), Politechnika Warszawska (Warsaw Polytechnic Institute), Politechnika Śląska (Silesia Polytechnic Institute) etc. and was presided over by Prof. Dr. L. Winogradow, Head of Katedra Technologii Porcelany A.G.H. (Department of Porcelain Technology of the A.G.H.). The present work was carried out at Katedra Mechaniki i Urządzeń Maszynowych Politechniki Warszawskiej (Department of Machine Science and Machine Installations of Warsaw Polytechnic Institute), under the leadership of Head of Department, Docent, Card 1/3

Master of Science, Engineer H. Knabe. The effects of surface texture on electrical and mechanical strength and on the resistance to high temperatures and chemical attack are described and discussed, demonstrating the need for a quantitative measure of surface texture. The object of this investigation was to assess the usefulness of various methods which could be adapted to this purpose. The methods tried may be classified into (1) metallographic and electron microscopic studies of the surface and of transverse sections of the glaze, (2) initial studies of glaze discontinuities by defectoscopy, and (3) measurements of surface roughness by interference and contact-profiling methods. It is concluded that (1) may be applied to the control of glaze thickness, and to control of technological glazing processes by direct or indirect (replicas) observations of structure and microtopography of the glaze. Deviations from standards (standard photomicrographs) could then be detected by comparison. Further research is needed in this direction, and into combined studies of the same surface by optical and electron microscopy to facilitate the interpretation of electron microphotographs. W.r.t. defectoscopy, the electrostatic method appears promising for the control of glaze quality.

Utilization of Phenol or its Substitution in the  
Manufacture of the Thermosetting Phenolic Glues

Orig Pub : Prace Inst. technol. drewna, 1958, 4, No 4, 5-88

Abstract : Investigations conducted by the Polish Institute of  
Wood Technology (in Poznan') established that glues made  
of cresolformaldehyde (I) and xylenolformaldehyde (II)  
and particularly glues composed of I and II mixtures  
(or glues obtained in the simultaneous condensation of  
cresol and xylenol with formaldehyde) are, as a rule,  
superior in properties to the phenolformaldehyde glues (III)

when employed as binding agents in the manufacture of plywood. The sensitivity to moisture of plywood made with I and II as compared to that made with III is of the same order of magnitude. In view of greater availability and of lower cost of cresol and xylenols as compared to phenol, it is recommended to substitute III in the plywood industry with I and II to the greatest possible extent. -- L. Pesin

Preparation of methyl lactate by a continuous method.  
 S. Chudzynski, *Prace Chem. Inst. Chem. Presmysl.*  
 1963, No. 8, 1-12 (Pub. 1962).--At the bottom of a glass  
 tube, 130 cm. long, 38 mm. wide, 105 cm. filled with granu-  
 lated glass, immersed in a bath, are introduced continuously  
 vapors of MeOH. At the top of this tube is added 30-40  
 g./hr. tech. MeCHOHCO<sub>2</sub>H (I) cont. 0.25-1.0 ml. H<sub>2</sub>SO<sub>4</sub>  
 in a ratio to MeOH of 1:10, resp. Vapors from the reactor  
 are passed into a column with temp. so adjusted that MeOH  
 distills and is recycled. Ester, H<sub>2</sub>O, and unreacted I are  
 collected in a receiver at the bottom of the column  
 over anhyd. Na<sub>2</sub>SO<sub>4</sub>. Pure product is obtained by  
 azeotropic distn. with C<sub>6</sub>H<sub>6</sub> and subsequent fractiona-  
 tion; bp 80°, n<sub>D</sub><sup>20</sup> 1.0696, av. yield 76%. The purity of I  
 does not influence the yield; and most efficient rate of addn.  
 is 30-40 g./hr. Ratio of I to MeOH should be above 1:10.  
 Acid agents decrease the yield, because of hydrolysis. The  
 main factors influencing the yield are (a) good grade of  
 anhyd. Na<sub>2</sub>SO<sub>4</sub>, which should be fresh, (b) cooling the re-  
 ceiver, (c) quickness of the azeotropic distn. and neutraliza-  
 tion of the mineral acid. 42 references. M. D.

Stanki i Instrument, 1957, Vol 28, Nr 7, pp 36-37 (U.S.S.R.) 121-7-19/26

PERIODICAL:

ABSTRACT:

In the "MOLOTOV" automobile factory at Gorki the spiral disk  
of the self-centering 3-jaw chuck were made of 40X steel,  
Rc = 20 - 25, and wore quickly when used. In order to increase  
their life the process of nitration was used; the semi-finished  
product made of 40X steel was hardened after previous mechanical  
treatment with an addition of 1,5-2,0 mm, after which it was  
highly tempered. After this, the hardness of the semi-finished  
product had risen to Rc = 23 - 26. After final treatment the  
surface cleanliness corresponded to the 6-th class. The sharp edges  
were rounded off as much as possible. Before nitration the  
disks must be rubbed and cleaned of grease. Nitration is carried  
out according to the 3-step process in an electric furnace at  
580°, in a muffle of heat-resistant steel; the workpieces are  
put in in such a manner that they do not touch one another.  
Nitration takes 24 hours, cooling takes place up to 100° in the

Card 1/2

Increase of the Resistibility to Wear of Self-Centering Clamping  
Devices. 121-7-19/26

muffle while ammonia is continuously fed, and later in air.  
The depth of the nitration layer is 0.25-0.30 mm, hardness  
Rc = 48 - 51. As is shown by tests of long duration in factories,  
the life of the nitrated disks increased to the 3-fold, and  
annual consumption diminished considerably.

THE CORROSIVE ACTION OF POTASSIUM (AND OTHER ALKALI) SALT SOLUTIONS ON METALS. I. ACTION ON CAST IRON AND LEAD. V. K. PERSHKEV AND G. I. CHUPAROV. *Ann. Inst. Polytech. Oural* 7, 81-90(1929-30); *Chem. Zentr.* 1931, T. 2390; *cf. C. A.* 26, 4433.

The actions of solns. of carnallite, sylvinite, NaCl, KCl and MgCl<sub>2</sub> on cast iron and lead were studied. Cast iron was most strongly attacked by NaCl and least by MgCl<sub>2</sub>, KCl having an intermediate action. Sylvinite soln. corrodes more strongly than carnallite. Dil. solns. are more corrosive than concd. The corrosive action of the former is 1.25-1.75 times that of water, while that of the latter is less than that of water. Satg. the salt solns. with air increases their corrosive action 3 times, light 1.7 times. The lower the content of impurities in the iron, the less it is corroded. A coating of wood tar serves as an effective protection for the iron and lowers the corrosion to 1/2. Lead is 9 times more resistant to the action of salt solns. than iron. M. G. M.
